Economic Policy Simulator is an interactive technical note which allows students to see the impacts of combining various economic policies on macroeconomic indicators.

This interactive technical note contains the following parts:

- Three short cases which describe the situations of the mystery countries
- A policy simulator
- An expert advice section to guide policy reforms
Students firstly read the information about the countries and then make decisions about; the tax rate, interest rate, social spending growth and structural reform, for the next two years.

The simulation then calculates the values of the indicators, for students to analyze. Some of the key indicators can also be compared graphically.
The simulator allows students to carry out as many analysis as they wish and to then compare these in a table. Expert advice discusses the best solution to each of the situations described in the three cases, and serves as a conclusion.
