Stock Market Game is an asynchronous interactive tool that serves as support to the economic environment surrounding the world of stock markets and investments. The tool focuses on the Ibex-35 index and the purpose is to analyze news and situations based on the results obtained in a securities portfolio.

In this game, students will learn how to:

- Perform a stock market analysis
- Analyze their weekly decisions based on financial news reports
Each player or group is assigned an amount in Euros which they have to invest in 5 stocks. Each week they observe the closing prices of the Ibex-35 index and decide on whether they should invest or divest each stock.

They then analyze their decisions based on the week's financial news.
Professors have access to a control screen where they can see the make up of the different groups, the shares in each of their portfolios, the buy and sell orders made in each turn, etc.
