Security Experts is an interactive technical note that focuses on IT security. It is complemented with a brief *Security Game* and an interactive example of a distributed denial of services attack (*the Ronnie case*).

The purpose of the program:

The material shows the main threats to a system and the possible protection measures. It gives us a practical day-to-day view of a systems administrator and the possible costs of IT insecurity.
The material contains an interactive game where the students have to play the role of a Systems Administrator. The objective of the game is to neutralize all system attacks, using the most adequate means.
The Ronnie case illustrates an interactive example of a real life attack.
